

n = 6 molecular-pool perturbations — 136 runs, all eight initial states

(A) 136 pool-perturbation runs — every cell keeps counting (green = all 8 initial states recovered; '+4 shift' = legal mod-8 phase shift)

(B) A full S_2 flip moves the count by exactly +4 mod 8 in 8/8 initial states — a legal phase shift, not a failure

(C) 0 lost lock, 0 readout-ok-but-causal-fail
0 same-type adjacent carry in 136/136 runs
