

Mid-run zoom: t = 578 - 620 h of the 1200 h run

sampling 1 min; the same frozen candidate, no re-initialisation, no parameter change at the window boundary

read windows here: 4 | bit0->bit1 reverses (whole run): 57 | bit1->bit2 reverses (whole run): 28

Model: HBY bit0 + ZMH current-code A0/F0 and bit1 + HBY A1/F1 and bit2, 34 states

Input: Han v53d upstream, true integration to the full horizon (no end-point interpolation, normalisation window unchanged)

Horizon: 300 / 600 / 1200 h from a single run; the 300 h slice reproduces the frozen certification exactly
